

AI Solutions Development Engineer (Generative AI & Automation)

A global organisation in the South West is expanding its internal Generative AI and automation capability and is hiring a Junior–Mid Level AI Solutions Development Engineer.

This role is ideal for someone early in their career who is hands-on, adaptable, and motivated by building real AI solutions, with a strong focus on AI agents, automated workflows, and process automation rather than chatbot-only use cases.

You will join a small, high-impact AI solutions development team operating in an agile, lean innovation environment. The team works at the forefront of the Microsoft AI ecosystem, collaborating closely with Microsoft subject matter experts and selected third-party partners to take AI initiatives from idea through to scalable deployment.

This is an excellent opportunity to gain exposure to cutting-edge generative AI capabilities, build agent-enabled solutions that deliver measurable business value, and help shape how AI is adopted across a large enterprise.

What We Offer:

- 27 days annual leave (plus bank holidays), one well-being day, and three days of optional volunteer days for charity.
- Hybrid working (two days in the office desired).
- Private health care.
- Minimum 8% and up to 10% pension contribution from the business.
- World class training directly from Microsoft AI subject matter experts.
- Up to £45,000 per annum dependent on experience.
- Strong long-term career development within a growing AI solutions development function, with opportunities to grow technically or take on broader responsibility over time.

Role Purpose

To accelerate the organisation's generative AI capability by designing, building, and delivering high-impact AI solutions that solve real business problems. The role combines AI engineering, agent-based workflow design, and practical automation, taking initiatives from early experimentation through to validated and scalable implementation.

Key Responsibilities:

- Design, build, and deploy AI agent-enabled workflows that automate real business processes such as file creation, task execution, data movement, and database updates
- Build agent-driven solutions using a combination of low-code, no-code, and pro-code approaches, selecting the most appropriate tools for each use case
- Develop and enhance RPA and automation solutions using Microsoft Power Platform, including Power Automate and Copilot Studio
- Identify when low-code tools reach their limits and transition solutions into more advanced, pro-code environments such as Azure AI Foundry, Fabric, and other Azure services
- Work across the full solution lifecycle including use-case identification, experimentation, value assessment, design, build, validation, and deployment

- Collaborate closely with business stakeholders to understand requirements and translate them into practical, secure, and scalable AI solutions
- Work with external development partners and specialist vendors where appropriate
- Take ownership of delivery of at least one major AI solution, while supporting smaller initiatives as capacity allows
- Support AI adoption across the organisation by demonstrating value, sharing knowledge, and helping others build confidence with generative AI
- Ensure solutions align with governance, security, compliance, and responsible AI practices

What We're Looking For

A motivated and adaptable engineer with a strong interest in generative AI, AI agents, and intelligent process automation. You enjoy building, experimenting, and iterating, and are comfortable working in environments where priorities evolve quickly. You are practical rather than theoretical and focused on delivering working solutions that create measurable value.

Ideal Background

- Early-career to junior–mid level experience, typically one to three years, in AI, automation, software engineering, or a related field
- Experience contributing to end-to-end solution delivery rather than research or experimentation alone
- Hands-on experience building AI agents, agent-style workflows, automated business processes, or generative AI solutions beyond basic chatbots
- Strong interest in agentic systems that interact with processes, APIs, data sources, and business workflows
- Familiarity with the Microsoft technology stack, ideally including Power Platform, Power Automate, Copilot Studio, and Azure AI services such as Foundry or Fabric
- Comfortable working in small, agile teams and taking ownership of delivery
- Strong communication skills with the ability to explain technical concepts clearly to non-technical stakeholders

Beneficial (not required)

- Python or other scripting or backend development languages
- Experience with generative AI or agent frameworks such as LangChain, Semantic Kernel, or similar tools
- Git, GitHub, and basic CI/CD concepts
- Exposure to non-Microsoft AI platforms such as OpenAI, Anthropic, AWS, or Google
- Experience working with or alongside third-party development partners
